Background and Validation

The Female Sexual Function Index (FSFI), a 19-item questionnaire, has been developed as a brief, multidimensional self-report instrument for assessing the key dimensions of sexual function in women.\(^1\) It was developed on a female sample of normal controls and age-matched subjects who met DSM-IV®-TR criteria for female sexual arousal disorder (FSAD) and provides scores on six domains of sexual function (desire, arousal, lubrication, orgasm, satisfaction, and pain) as well as a total score.\(^2\)

The FSFI has been validated on clinically diagnosed samples of women with female sexual arousal disorder (FSAD), female orgasmic disorder (FOD), and hypoactive sexual desire disorder (HSDD).\(^2\)

Physician Instructions

Participants are to be allowed to complete the FSFI alone, in a private room.\(^2\) Instructions for scoring appear on the last FSFI Pocket Card.

A copy of the FSFI is attached to this card.

Thank you for completing this questionnaire.
The individual domain scores and full scale (overall) score of the FSFI can be derived from the computational formula outlined in the table below. For the individual domain scores, add the scores of the individual items that comprise the domain and multiply the sum by the domain factor (see below). Add the six domain scores to obtain the full scale score. It should be noted that within the individual domains, a domain score of zero indicates that the subject reported having no sexual activity during the past month. Subject scores can be entered in the right-hand column.
